# AUTOMATIC COMPACT AIR VENT VALVES

## DESCRIPTION

Miniluft valves are automatic, float-operated air vent valves designed to remove air and gases from heating or cooling systems. Their small size makes them ideal for applications on manifolds or distribution kits housed in containment boxes.

Despite their small size, they are very effective in removing air during both loading and emptying, helping keep the various areas of the system where they are installed free of air. With their high functional guarantee, these automatic air vent valves must be considered a system safety device.

## OPERATING PRINCIPLE

The accumulation of air bubbles in the upper part of the valve body (air accumulation pressostatic chamber) causes the float descent and, consequently, the gas ejection device opening.

For the valve to properly operate, make sure that the water pressure remains lower than the maximum discharge pressure value (4 bar for the model Miniluft Compact - 6 bar for the model Miniluft).
