

PRODUCT CATALOGUE

ISSUE 2.0

This guide has been developed with the most innovative products for fire rated applications.

With the inclusion of products from some of the most recognised manufacturers in the fire rated industry, you can be assured that your choice in products has been tested, approved and is right for its application.

For competitive pricing of all products, contact us for our comprehensive price guide and to discuss your needs.

We can also help you plan your site needs with personalised help to make sure you get the right product for the right application.

TABLE OF CONTENTS

Cast in fire collars	04	Fire pillows	18

22CIC-H150FWS	150	6

See page 6 for Low Profile design

CAST IN FIRE COLLARS INSTALLATION FEATURES

CAST IN FIRE COLLAR INTERNALS

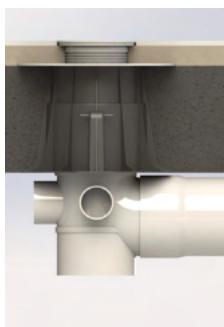

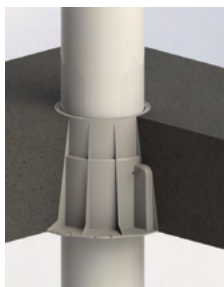

Where a building element is penetrated by a service, fire collars are installed around pipes and other penetrations so that it does not compromise the fire resistance level (FRL) of the building element (wall or floor) the pipes pass through.

Cast in collars are made to be cast into concrete slabs for floorwaste and stack applications. There are important differences between the stack test and the floorwaste test

The Stack Test when tested under laboratory conditions has 2 meters of pipe on the non-fire side and has thermocouples placed in an insulated position on the outside of the pipe, 25mm from the wall or floor. These cast in collars are colour coded white.

The Floorwaste Test, which is more onerous than the Stack test, has thermocouples place on an open part of the grate on the top side of the floor slab. These cast in collars are colour coded black.

The one piece cast in collar is a strong plastic body with extra ribbing to ensure there is sufficient strength prior to and during the concrete pour.

Removable hi-vis yellow lids and patented pipe guides allow for fast installation and are easy to see when installed onto the deck.

INSTALLATION OF CAST IN FIRE COLLARS

Unique cluster testing means you can install your collars closer together providing easier alignment of piping from level to level, simpler layout so compliance is easier to achieve and potential to reduce the service areas.

Collars tested for floorwaste and shower applications are fully tested with a range of pipe types and sizes including PVC, HDPE, VALSIR, DBLUE, PEX, PEX-AL-PEX, RAUPIANO, WAVIN and so on. Many of these tests include testing with fittings fully installed into the fire collar so it is easier to install on site whilst ensuring compliance. Please talk to Drillfast and your certifier to ensure you have the Test Reports and Test Assessments you need to allow you to get the job done.

RETROFIT FIRE COLLARS

INSTALLATION FEATURES

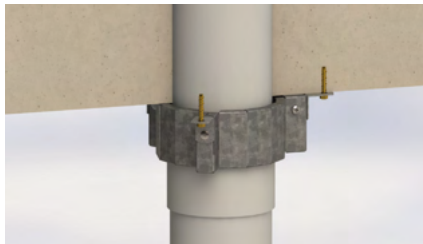

RETROFIT FIRE COLLAR IN ACTION

Building fires are a real concern in every country. Passive fire systems, including the installation of retrofit fire collars, help make it safe for the occupants and emergency personnel, in the event of a fire.

Retrofit fire collars are available in a range of styles and sizes for many application types. Due to the many different applications on site these collars are tested in multiple lab conditions with consideration for wall construction, wall

thickness, hole size, service size and type, fire resistance levels and fixing options.

Due to the many variables with testing and installing retrofit collars the Australian Standard AS1530.4:2014 says, "All Fire Resistance Levels (FRLs) achieved on framed plasterboard wall systems are applicable to concrete and masonry wall of equal or greater thickness"(AS1530.4:2014 Section 10.12.2 (c)).

INSTALLATION OF RETROFIT COLLARS

Retrofit collars are usually installed after the substrate, such as a wall or floor, has been constructed. When installing these collars, it is important to remember that they are installed correctly. Remember:

Check the collar has been tested on the matching substrate

Check that the service type and penetration size has also been tested in this application.

Ensure the correct fixings are used for installation

Ensure that the correct fire rated mastic is used on relevant installations for a fully compliant system.

To support the installation, correct documentation is just as critical as the correct installation. Reference documentation may include Test Reports, Test Assessments and Fire Engineering Reports to just name a few. Subject to specific project requirements, you should always make sure you have the most current and up-to-date supporting documentation.

FIRE RATED WRAP

Install with Fire Rated Mastic

FyreWrap® is a foil-faced, fire protection wrap/blanket designed to provide fire rating to ducts, kitchen exhausts, smoke spill systems, penetration seals, structural steel elements. Also provides insulation against metallic penetrations of plasterboard, concrete and masonry walls and floors. For use on services including steel, copper and brass pipes, pipe with combustible insulation, cables with and without cable trays.....

FIRE DAMPER GRILLES

INTUMESCENT FIRE DAMPER SQUARE AND ROUND

Intumescent fire damper grilles allow the bi-directional movement of air through fire-rated walls and floors. When a fire occurs, the intumescent slats in the grille expand rapidly to form a compliant fire barrier. These dampers are easily identified, with foil covered intumescent slats in a rigid steel frame. Installation is quick and easy.
